

SOLARFURNACE

Solar Furnace

How it works: The Solar Furnace system is a turn key solar heating, ventilation and domestic hot water solution. It can provide whole house heating, ventilation and hot water supply for a home from 0-3000 sq ft. The system works by providing fresh solar air ventilation to an integrated HRV inside the solar hydronics furnace with solar hot water and an on demand tankless hot water* system. This efficient combination delivers effective solar heating (up to 50 000 BTU/hr solar energy) and natural gas or propane whole home heating system. Radiant floor and swimming options can be added to the system as well. The Solar Furnace system can reduce your heating and electricity bills (ECM motor in furnace standard). It can provide savings from 20% up to 60%.

* Dependant on size of home and heat loss.
Boiler is sized accordingly and can be upgraded to condensing types.
