

For Immediate Release: February 18, 2005

**SOLAR AIR COLLECTORS OFFER A POSITIVE MOVE
TOWARDS SAVING ON ENERGY AND REDUCING GHG**

Toronto, ON February 18, 2005: Your Solar Home Inc., a new Canadian company, introduces a modular solar air heating system for residential and industrial use. Called the SolarSheat 1500 Solar Air Collector, the system provides energy savings and efficient air heating for your home, cottage or business. The SolarSheat helps reduce your heating bill, improve air quality indoors and helps reduce GHG (Greenhouse Gas) which helps with the new One-Tonne Initiative.

Your Solar Home is meeting the One Tonne Challenge with the SolarSheat. Three SolarSheats meet the one tonne initiative and can provide a complete air exchange for a 1,000 square foot room.

The SolarSheat 1500 is a self-contained, self powered system and is easily installed on rooftops or south facing walls. Preheated air is heated through the collector and then drawn in to your home or building by a fan. The company has also introduced a Solar HRV (Heating Recovery Ventilation System) for residential and industrial use. The SolarSheat 1500S and Solar HRV can be combined to provide air heating and ventilation using fresh preheated solar air. "This increases the performance of the HRV, delivers fresh warm air to the building on sunny days, saves on energy costs and CO₂ emissions," says Todd Kirkpatrick, Company President. **Your Solar Home's** patent pending modular design allows for multiple SolarSheat collectors to be easily connected together. This enables a larger collector array for industrial applications.

Your Solar Home uses government certified solar calculators which can measure the energy savings (for consumers and building owners alike), by showing the reduction in energy, greenhouse gas emissions and solar savings. At today's energy prices, a renewable energy system will pay for itself in 5-6 years, while providing up to 50% in savings on your utility bill.

The SolarSheat 1500 and 1500S provide supplemental air heating and are not designed to replace your traditional furnace or primary heating system.

Your Solar Home's products are available from authorized distributors and dealers.
